TOTAL (known to be alive)						7	15	22	20	17	17	0	4	10	6	4	3	

Notes: Total Seen includes birds alive because they were seen in later years. Fledglings surviving their first year are not listed.
 2004 was a notable breeding season, notable, occasioned by the very large number of aggressive long-tailed cockoos about the nesting areas. 2005 Cyclones Meena and Nancy made searching difficult because of all the trees down.
 Indicated Mortalities during Introduction = 27% and each year = 8%.
